

Inline math in paragraphs

By Pythagoras, $a^2 + b^2 = c^2$, which holds for any right triangle.

Greek letters render correctly: $\alpha + \beta = \gamma$, and they share the body baseline.

For display-style equations (centered, taller), use `Document.Math` instead:

$$\int_0^{\infty} e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$$

Inline-math width factors into line breaking, so a long expression like $x^2 + x^3 + x^4$ stays as a single non-breakable unit and moves to the next line if it doesn't fit.
