

Kardec Quarterly Report

Q4 2025 — *Generated end-to-end by Kardec v0.1.0*

1 — Executive summary

Kardec turns a fluent Go DSL into a PDF that reads like a document. It is style-driven: **DefineStyle** entries propagate through resolution and are honored by the layout engine, which is what produces the corporate blue you see in this section's heading.

Compared to grid-first generators, the output here flows: paragraphs justify, headings claim vertical breathing room, and overflowing content moves to the next page automatically.

2 — Footprint

Kardec ships four bundled font families totaling roughly seven megabytes (Liberation Sans, Liberation Serif, Carlito, JetBrains Mono — each in Regular, Bold, Italic and BoldItalic). The PDF writer subsets nothing yet, so output files are larger than they will be once subsetting lands.

Bundled families and their roles:

Family	Role	Faces
Liberation Sans	Default sans (Arial-equivalent)	4
Liberation Serif	Default serif (Times-equivalent)	4
Carlito	Calibri-equivalent for Word-style docs	4
JetBrains Mono	Monospace, code blocks	4

3 — Wiring the renderer

To enable `Document.Render`, callers blank-import the orchestrator package:

```
import _ "github.com/arthurhrc/kardec/render"
```

That single line installs the layout + typography + pdf wiring through an init hook, which keeps the kardec package free of an internal/layout import that would otherwise introduce a cycle.
